**Reference Manual**  
May 19 2021 The design and implementation of the Maple system is an on-going project of the Symbolic Com putation Group at the University of Waterloo in Ontario, Canada. This manual corresponds with version V (roman numeral five) of the Maple system. The on-line help subsystem can be invoked from within a Maple session to view documentation on specific topics. In particular, the command ?updates points the user to documentation updates for each new version of Maple. The Maple project was first conceived in the autumn of 1980, growing out of

discussions on the state of symbolic computation at the University of Waterloo. The authors wish to acknowledge many fruitful discussions with colleagues at the University of Waterloo, particularly Morven Gen tleman, Michael Malcolm, and Frank Tompa. It was recognized in these discussions that none of the locally-available systems for symbolic computation provided the facilities that should be expected for symbolic computation in modern computing environments. We concluded that since the basic design decisions for the then-current symbolic systems

such as ALTRAN, CAMAL, REDUCE, and MACSYMA were based on 1960's computing technology, it would be wise to design a new system "from scratch". Thus we could take advantage of the software engineering technology which had become available in recent years, as well as drawing from the lessons of experience. Maple's basic features (elementary data structures, Input/output, arithmetic with numbers, and elementary simplification) are coded in a systems programming language for efficiency.

Like all Unix shells, it supports filename globbing (wildcard matching), piping, here documents, command substitution, variables and control structures for condition-testing and iteration. The keywords, syntax and other basic features of the language were all copied from sh. Other features, e.g., history, were copied from csh and ksh. Bash is a POSIX shell, but with a number of extensions.

[The Bomber Command War Diaries](#) Sep 10 2020

Bomber Command's campaign started on the very first day of the Second World War and ended within a few hours of the final victory in Europe five and a half years later. It was an attempt to win the war in Europe by strategic bombing on such an enormous scale that historians have only recently begun to piece together the finer details of the individual raids. There have been many books about Bomber Command, but Martin Middlebrook, the aviation historian, and his research colleague, Chris Everitt, were the first to compile a complete review of all the raids and the background stories

to this fascinating campaign. They undertook the gargantuan task not only of documenting every Bomber Command operation but also of obtaining information from local archives in Germany, Italy and the occupied countries, on the effects of the raids. Little of this material had been published previously, and never before had the two sides of Bomber Command's war been brought together in this way. The Bomber Command War Diaries has become the standard basic work of reference on this extraordinary campaign. This edition includes retrospective

observations and a new appendix.
